127 - FYI – BENDING THE WIPER BLADE ARM. Why you say? The wiper arm used by Tiffin with the recessed windshield does not provide enough pressure AGAINST the windshield to properly wipe the windshield. I do not remember the TRVN member's name who contacted the engineer who in turn supplied the following information, however thank you.

As shown above the windshield is recessed 2 ½ inches this wiper arm was not designed to be used with a recessed windshield. One quick method to correct the problem is to insert a 15 ° bend in the wiper arm as seen below. While the arm is strong it can be bent using just your hands. The bend needs to be rechecked over time as the arm will lose the 15 ° bend over time.
