**FORTY-FIRST** - coach modification, **ELECTRIC WINDOW SCREEN LATCH**. I constantly find myself trying to stick my head through the screen on the driver's side electric window after opening the electric window. Finally decided to make a modification which I believe will prevent the occurrence from happen again.

A small piece of aluminum stock was used to fabricate a latch which can be flipped down to latch the screen to the window, now when the window moves the screen moves with it opening or closing with the windows movement. If I desire to un-latch the screen the latch can be flipped up which unlatches the screen from the windows movement. Stainless steel hardware was used with one except, the one piece of aluminum stock.

With the screen latch in this position when the window is powered open the screen opens with the window, also when the window is powered closed the screen and window are both closed at the same time. Just flip the latch up to disable the simultaneous window/screen function.
